

The telephone

By: Carina

Telephone

The telephone was invented by Alexander Graham in 1876, March 7th. The telephone was invented to audibly communicate with others such as friends, family, and exc in a way easier procedure. When the telephone was introduced to the Industrial Revolution it was very useful to people for communicating with others by long distance. The telephone also made communication between businesses much faster and easier instead of relying on mail. With mail you wouldn't know if the person you were sending it to get the mail or not that is why telephones come in handy. With telephones you can just give the person a call and talk to them like if you were talking to them in person.

Problems about the telephone in the Industrial Revolution

There were a few problems about the telephone that weren't very useful to humans. Firstly, one of the problems about the telephone in the industrial revolution was how it wouldn't save anyone's number. Secondly, another problem about the telephone was how it wasn't wireless. Thirdly, telephones in the industrial revolution were very heavy. The telephone was nothing compared to what phones look like today.

Main problem/ consequences

The main problem about the telephone was how it couldn't save anyones number.

Consequence A: You would have to rememberize peoples phone numbers in your head or write them down.

Consequence B: If you had an emergency and had to call someone right away you couldn't just go to your contacts and find their number like we do now.

Consequence C: If someone random called you, you wouldn't be able to tell who they are because it wouldn't say their number and you won't know who it is.

How phones are like now...

Phones today let you do many things that you couldn't do in the industrial revolution. For example phones now are wireless, light weight, you can download many apps, take pictures/ save them, save numbers in your contacts and exc. These new advancements make the phone easier for humans to use now a days, unlike back then in the industrial revolution. In the industrial revolution phones were very weird and confusing to use but now a 5 year old can learn how to use a phone.

Positive/
negative
consequences
about
phones to
day

Positive

- Way easier to use
- Wireless
- Less heavy
- Can text
- Take photos

Negative

- Addicting
- Kids have them
- Can cause brain cancer, blurred vision, sleep disorders and exc.

Future phone

I think in the future phones are going to be very thin so it would be easier to carry around and it would also be light weighted. I think there's also going to be tons of cameras on it like apples iphone11. The cameras are going to help with good quality and maybe each camera has a different prespective when taking pictures. I think after these changes the phones are going to be way better and advanced.
